(54) An ink jet fluid system and device, and a method of preventing fluid flow from an ink jet print head after shut-down.

(57) An ink jet fluid system includes a print head (10), defining a fluid reservoir (12), and further including an orifice plate (18) or at least one orifice communicating with the reservoir (12) for generating a jet drop stream (20) from the fluid flowing through the orifice or the orifice plate (18). Inlet and outlet valves (28, 32) are connected to inlet and outlet openings (14, 16) of the print head (10), respectively, and a siphon line (30) extending generally downward is connected to the outlet valve (32). A float valve (34), connected between the siphon line (30) and the fluid supply tank (22) for the print head (10), vents the lower end of the siphon line (30) to atmosphere to produce a sub-atmospheric fluid pressure within the print head (10) after shutdown of the printer. The float valve (34) includes a float (46) which prevents air from entering the fluid supply tank (22) through the valve (34). The float valve (34) further is arranged so as to prevent ink within the valve (34) from flowing out of the vent opening (44).
